

Brief Introduction to newly added functionality of “ Baldr” project

SEM2014

Li Wei

In order to implement newly added functionality, I fixed following
Classes in app.

Android part:

Firstly, I add a button called “ blink” in `activity_Main class` under
The layout

Secondly, I added lines of codes in `Edit_Light.java` class in order to
Associate with button click event.

Thirdly, I add a `Json` code block in `MessageHandler` class in order to
change light state alternatively.

Finally, I add a method called `publishBlink` which send message
according to RFC format to MQTT broker.

Erlang part:

In `Baldr_Light` class I add `update_lamp(state)` method to handle “ Blink”
state of lamp.
